

```
<body>  
  <div id="container">  
    <button id='btn'>Click Me!</button>  
  </div>  
</body>
```

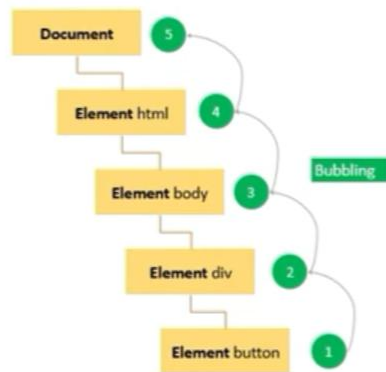

1. Event bubbling

In the event bubbling model, an event starts at the most specific element and then flows upward toward the least specific element (the document or even window).

When you click the button, the click event occurs in the following order:

I

- button
- div with the id container
- body
- html
- document

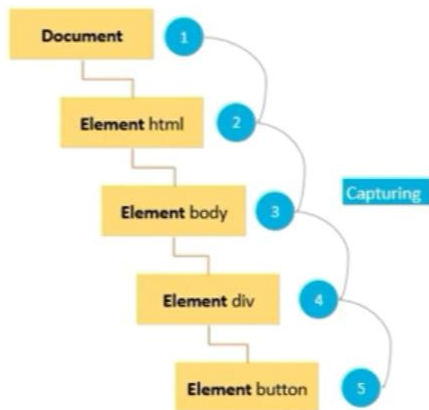

2. Event capturing

In the event capturing model, an event starts at the least specific element and flows downward toward the most specific element.

When you click the button, the click event occurs in the following order:

- document
- html
- body
- div with the id container
- button

Click to add title

addEventListener(event, function, useCapture);

- The default value is false, which will use the bubbling propagation, when the value is set to true, the event uses the capturing propagation.
